Paper March 8th 1824

W. & H

Dear

My

Charles R. Garrison

Philadelphia

On Dysentery.—

Of the multiplicity and various diseases to which mankind are subject in advanced life, and which tend to make old age so emphatically a burden, Dysentery is not the least interesting, its prevalence demands for its own kind attention, and adds to that class of patients who are thought and by it we can have but small hope of effecting radical cure, yet say we who have witnessed this suffering in others, are almost ready to believe them must surely resign all claim to that benevolence and humanity which ought to characterize a Physician. To him, when the disease attacks the aged, the lamp of life, seems to be smothered by a few drops, and soon to be extinguished, the old, which sometimes it will have done out, yet here our duty is not left urgent, to watch the progress of the disease and apply such remedies to the most alarming symptoms, as they arise, until at the termination of the disease we cannot longer, predict the last catastrophe, we cannot assist and forward the path to that grave, from which all our endeavours cannot save our patient.

For Morale—on this interesting disease will be found in the following pages.—I am aware that most of them are common

Let many may appear superficial, mixed and inconsistent, cannot
be expected from mere opinion, and frequently has more than the
attribute of youth. If I dwell in placing in a clear light
the opinions and practices of others, my design will be
answered the I add little that is my own. It is the high
aching of some, the basis of the foundation of situated
to this light to all around them, where to others is given the
humble the not easily task of collecting these rays, then
then concentrated light forms one perfect focus, let man
gives more as more in their higher sphere where I then
to perform the part to which my limited powers, more
limited experienced compare me. — To a right understanding
of the subject some notions of Disphy in general form are
inwardly practical, these being brief premises we have
before to the acquisition of our mind subject. Disphy
is a general collection of facts, theory in any exact statement
only as in the actual distance of the facts — Disphy forms
a genus in Culture, Disphy, Disphy, Disphy, Disphy, Disphy,
Disphy, Disphy, Disphy, Disphy, Disphy, Disphy, Disphy,
Disphy, Disphy, Disphy, Disphy, Disphy, Disphy, Disphy,

of exhalation & absorption. Exhalation may be increased
either in a form or an atomic combination of the general system
has the same effect, result from the causes & accompanying
effects? we do not know. And that great reaction of
Physiology and Pathology, smoothes the fact but gives no
reason for it — he would not escape the old hypothesis of cold &
repels & transpiring fluids which in former times are even to
used to explain the more comes from them. This explanation
would be totally overthrown by the laws of Life which he
has so beautifully described, the increase of exhalation is in
some cases so great that as much fluid is thrown out in
twenty four hours, as in a natural state would have been
in so many days. This is very frequently seen after the
operation of Paracentesis. Little asphy single would form
a swarm of ulcers of the formation yet it most generally
appears as an irregularity in both, one is always always
related inordinately to the other. The first
Symptoms of Asphy, and generally a dropping of the
pale of face, cough, accumulation of humors, loss of appetite

operation on the line

remembrance in the business of science, the digestion operates in
the most necessary, and constant, concerning frequent manner
the appetite & improves largely the patient very much
the pulse is frequently in the beginning very much weak and slow
pulse - the system generally is at other times very much affected
sometimes there is a very great swelling in the pulse -
in the progress of the case, in many forms of ascle, fluctuation
of fever and the pulse and outburst the nature of the case
The Cause of ascle, and the use of violent spirits, certainly
a superfluity of any kind, the attack of very debilitating
would as force it; any thing in fact which weakens the
general system very much, may act as a cause -
Authors remark that it arises sometimes from an epidemic
invasion in the system, which seems to be only a limited
way of saying that we are ignorant of the true cause
Diagnosis - The best way of seeing in the case are the commotion
of the system from the diarrhoea & the skin with the fluctuation
of fever - little in South American Ascleps it is supposed
to arise a dyspepsia from the effect of a hot day, yet in cases

method is quite difficult, & uncertain in forming our opinion is
not to be rejected because it is not offered as a scientific guide.
In the disease a disposition of impetuousness may be traced from
the action of humors. If on any means obtain a free flow of action
and the can be genuine acety, there is almost always an
abatement of the symptoms, which of course is not the case in the
case of the cancer with which it might be confounded.

Prognosis. — The prognosis in acety depends very much
on the state of the general system and on the habits of the
patient. If the be weak, debilitated or intemperate and
but on the person most frequently attacks will then prove
of a particularly, it will almost be a certainty from the
known or later recidival case is in but case almost out of
the question. If the symptoms thus a general hyaline system
the affection of the case and much increases, state of the
constitutions be understood all may be well.

The different kinds of acety vary very much in the
fault with which then one may be affected.

Treatment. — On the part of the Subject we have seen to
be best as an outline to enlarge on the treatment of Dysarthria
and that of all depends is bound. — In beginning the
treatment of the system be in a true state, the thought
fully give the patient advice as we must resort to explaining
ourselves, as we cannot expect to stimulate the attending
humans entirely, where the concepts are in an excited
state. To effect the necessary condition we may in small cases
start without fear to the Subject and along it fully con-
fide our purpose, in some cases however it must be
very cautiously done, we too much depend the system
has not and then a case arises when the nervous is
totally unmanageable, here of our work to alter ^{the} state of
we want to annul what has a cooling complete
power or to master some of the class Dysarthria
of the former ability the best and easier the only method
has that power in any degree is that of the State of the
the balance of system we and the secret action, but
they require considerable caution in their management.

I shall be very
 much interested in
 to present our
 a lesson the of
 them to people of
 various about to
 be & the best to
 be and some
 much more and
 are likely to
 be long and to be
 long. There are
 but of our way
 of the school may
 be in the way of
 a school
 being in the face
 of the same but
 I think we have

of solar action being reported to them, our attention to
more minutely and more measured. Then we find
two prominent indications - 1st To write ourselves to
as to remove the effects of the 2^d To strengthen the
system. To judge the fact of them we have a whole class
of comets almost every individual of which has at some
time or other been treated as almost infallible. All
are and most are treated to be dangerous for the very
unmistakable uncertainty of their operations - for
always according to direction. Of this class of comets
many have and to which the great astronomical of our
science have and are making additions from the number
line of our dangerous planets, then and none or at least
very few which may not, which have not been seen east
or away in depth, and by some the very prominent fact
of having one in the future of one seems to ^{another} greatly promote
the flow nature but find, then which and in general all
and which we have just made, then the effects.

The most popular and perhaps the most sincere of our most
of spirits - when sometimes with Calicut it has been
very generally and very assiduously the companion of our parties,
I still remain as firm, probably it, but this I do not
place in very high favor, rather set from its use
It is not *Staphylinidae* as follows maintains although
from being necessary to its operation as a domestic
was secured by his great friend *Homer*. *Lepidoptera*
was formerly held in great respect in the city, and indeed
but from the great difficulty of regulating its action, was
to obtain its advantage and avoid its noxious effects, it left
in the opinion of practitioners than formerly. The use
of the present *Leaves* or *Waxes* of the structure taken
from it then a day, the aim to be gradually, but very carefully
increased to be as conducive to the development of its power.
The museum report at the time at least, the very high
importance of the late *Prof. Watson* who was opposed of being
and American cases of anxiety with it, but before he
left, he also was much by attached to it, and *Lepidoptera*

is its power. It has, certainly been the object of great praise
as others might have been expected from its true action.
It is perfectly natural that the Philistines in whose
land it has come, as it often will, ~~to~~ must be
satisfied with it. Hence praise it without misanthropy
and measurement it without assumption.
and on the other hand, it is just as natural that he
who has observed its effects, who has seen it (and this is too
often the case) bestowing its own immortality, must see
that he should condemn it loudly and denounce it. He
is it a gift of most equity, fully a true contri-
bution to the future of the world. Some philosophers
announcing it as almost infallible when everyone
it as such to come. — On all these accounts, of but
impartial opinion to be found only among the young
when asked to praise or blame is to be expected too
among the experienced whose opinions, having no
the form of opinion, are varying as the winds that
inquire of them. — As it is the age and the school.

Hydrothorax is a term in the Chest is an effusion of serum fluid into
the cavity of the Chest. It has been ascribed to Catarrh - Degeneration, pain
of the fine peripneural membrane of the Lungs, Serous washings from
that, especially in opening the Pleural cavity & lung punctures
of fluid into the Chest, perceptible to the Patient & Practitioner -
Many writers have ascribed much time & labour in attempting to
distinguish degrees of the Lung. "Hydrothorax Pleuriticum" when the fluid
is effused into the Pleural substance of the Lungs. Degrees of the
Pleuriticum - Hydrothorax when it is contained in the Pleura
from genuine Hydrothorax. But these nice distinctions
will perhaps in short Asthology count as an fraction of
little & no importance as it is impossible to point, out, with
any degree of accuracy, among the Lungs of the Patient. -
Ultimately this is not to be denied even if it were practicable, the same
treatment being proper for all degrees of effusion in the cavity of the Chest,
they may in a purely practical point of view be considered as
one & the same disease. The first symptom of Hydrothorax is
a loss of strength, an inability for muscular action, the Patient
particularly, who by attempting to ascend a slight hill,

top of the path
was born of the
a more steady, than
length, independent
present at first
length, brown, smooth

and that being the

top of this, palpitation of the heart and accompanying symptoms
were seen. It was thought to be connected with the existing case
is more steady, these symptoms are also particularly the top of
Vergil's particularly striking in the present. — The symptoms,
however at first, are only transitory, after a certain, at
length becomes constant. In the progress of the case the
patient finds it necessary to lay well his head higher
than he has been accustomed to do. — The last mentioned
symptom is much suggested on by authors as a certain
sign of dropsy, but it is not an invariable concomitant
of dropsy and of course not decisive of that high degree
of congestion which has been found in it. —
A case occurs in the Philadelphia Medical Review, where
a patient having all the other symptoms, was pronounced
not apoplectic from his being able to lay in the horizontal
position, could speak easily, but examination feet
Motture showed the presence of fluid.
In explanation of this anomaly it was advanced, that
the chest being nearly full of water, the pulmonary artery

you are a

quest in all positions - and allowing this to have been
the case at the time of onset, the propriety of which
we very much doubt, it could not have been the
fact in the progress of the case at which time it
was observed - therefore the explanation is of no avail -
but our own error to avoid our ignorance of the cause,
and to place the fact in the number of those
arising from general rules, which we to often
mist with - which would seem to show our purpose
to convince us of the occasional fallacy of our bet-
ters and to warn us not to put too much
confidence in any one symptom, but to enlarge
our view as to embrace & contemplate together all
the signs of a case if we would form a correct
opinion of its nature - But we must return
from a digression which has carried us farther
than we had intended, but which, we trust
is not altogether without its utility -
The case progressing, the Liver & Gallbladder often becomes

man, she is so

that it appears as if

that she is the mother

namatory, this is at first only observed after long standing
then it appears at the later part of the day, but is
short in the morning - at last it is constant and
from increase to is quite accepted as morbidity
as to the sufferings of the patient -

The general health must fail rapidly, the strength and
spirit are gone, sobbing - low emotions and other
appropriate symptoms distress the patient very much
more than an attack of this sort ever much like suffering -

The disease being now fully formed it progresses, when not
impeded by curative measures, is very violent, sometimes
the length of life is very quickly terminated when in other
cases the flame will linger in its heat, and seems
to burn on in spite of the total exhaustion of the powers
of life. - In the termination of some cases, a striking
peculiarity is observed in the suddenness of expiration
the patient will fall down and instantly expire
when to all appearances no worse than usual

Incurable inflammation, especially and is very apt to extend
Typhoid, it is also sometimes a consequence of it, & arises in
the acute affections of the liver. Inflammation, from febrile
effluvia, often arises also, the same. It also now and then
from the long continued & debilitating disease. It may
generally maintain a general typhoid tendency in the
system as a cause of Typhoid. Of the diagnosis
The two significant symptoms in this disease is that, first
and 1st that progress in the abdomen increased the oppressed
2nd the fluctuation of fluid being present in the Thorax.
The Prognosis, as in most other cases of dropsy, depends
very much on the ^{degree of} general health enjoyed by the patient.
It has attended to much perspiration & great improvement of the
pulse are generally considered most dangerous.

Of the Treatment In the management of an ascites of
Typhoid, of there be much action in the pulse the use
of the Laxative is essential & necessary, we cannot however
agree that it is requisite to purge in case of absolute fulgour
on the skin be then acting on the pulse, how the use
